

# Downloading Kicad On Windows 10

1. Open your web browser and go to the official KiCad website at <https://www.kicad.org/download/>.
2. Once on the downloads website, choose the preferred operating system i.e Windows 10 for this installation.

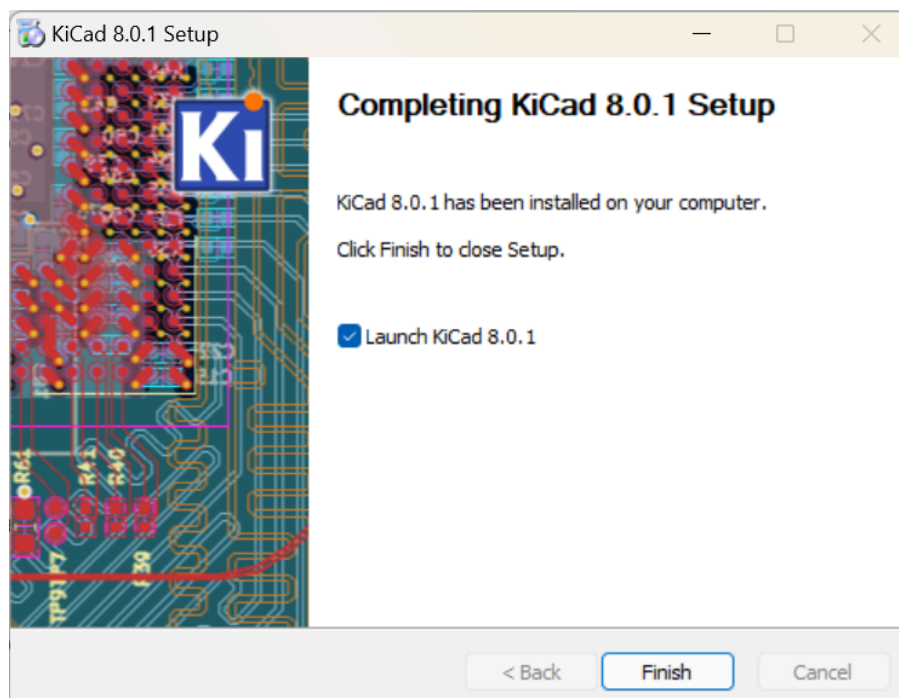

3. Scroll down to the North America section and click on the "Clarkson University"'s server to begin downloading

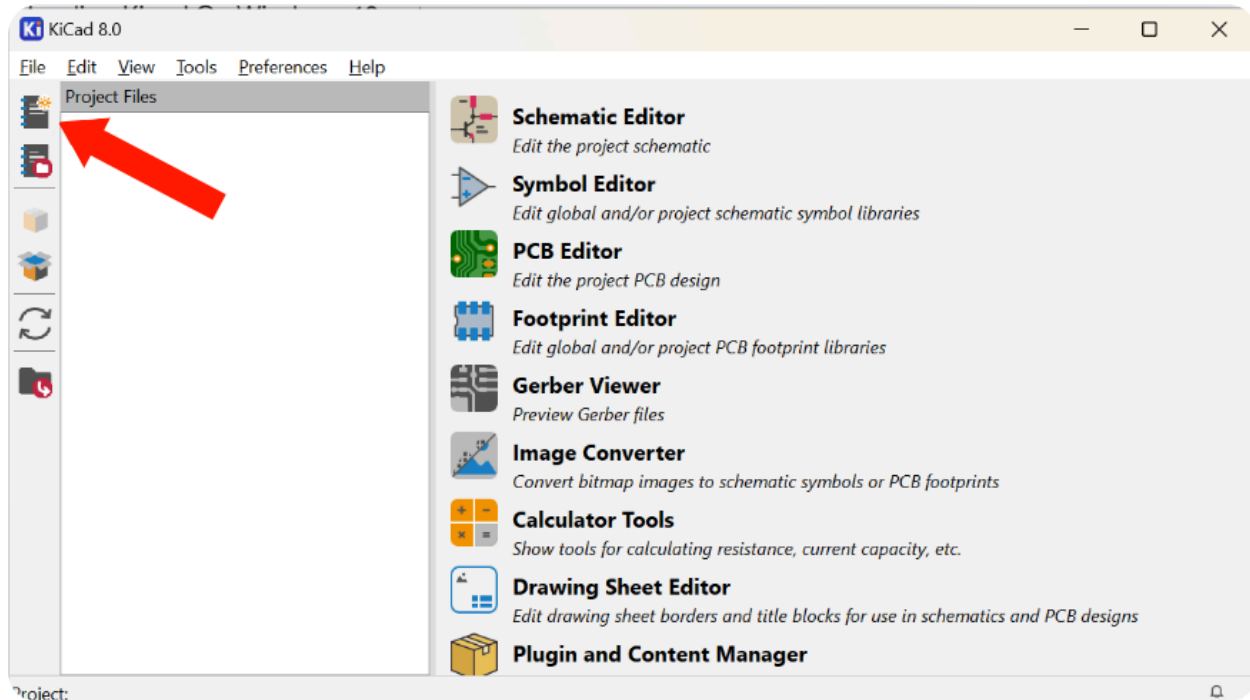

4. Once your download is complete, locate the downloaded installer file (ending with **.exe**) and double click on it to start the installation process. Then follow the on screen instructions to complete the installation keeping all the default selections.

5. After the installation is complete, the KiCAD application will be launched if you have selected the Launch option or you can usually find KiCAD in the Start menu. If you open it for the first time, select default settings to open the application.
6. Once KiCAD is open, you can either start a new project or open an existing one. To start a new project, select the first icon (which has a book symbol with a yellow sun on top right), and give a project name.

Your setup is now complete. Next steps will be walked through during the workshop. (If you face any problems during the downloading process, remind us before the workshop and we'll help you get it resolved.)
